Children's Mercy Research Institute | Kansas City, MO

Children's Mercy Research Institute is one of 31 exclusively pediatrics-focused research facilities in the U.S.

The nearly 400,000 SF, 9-story structure stands as a testament to the importance of translational medicine — research aimed at determining the relevance of pediatric diseases through novel discoveries.

The building's design communicates research that will take place within. The contemporary, all-glass facade highlights how science is integrated throughout: the design of the helix-inspired monumental stair, the DNA discoveries reflected in the curtain wall, and the artful balance between energy efficiencies and aesthetics. All these elements helped bring true collaboration to the forefront, allowing the true vision of the Institute to be realized.

Square Footage: 400,000 |

Completion Date: September 2020
